

NeuroPro Specialty™ for

Examination: Whole Body, No Boundaries

Course Description

Examination of the Human Movement System is always a challenge because of its inherent complexity. It can be a daunting task in severely injured, medically complex patients as well as in high functioning, community dwelling patients. An incomplete or faulty examination may lead to less effective interventions and diminished outcomes. In this course, the iterative process of differential diagnosis will be the focus of the course. The course will prepare you to make accurate diagnoses and continue with rigorous re-examination for the course of treatment.

Ideal for:

- Certified Neurorehabilitation Professionals who have completed The NeuroPro Standards Course
- Therapists who have attended other neurorehabilitation certification courses
- APTA Neurologic Certified Specialists (NCS)

Upon Completion

You'll know how to:

- Utilize an expanded knowledge of anatomy and kinesiology to further understand and examine the Human Movement System
- Integrate all body segments into the examination
- Establish “gold standards” within salient activities
- Move from observation based signs to differential diagnosis
- Make more sensitive and specific tests of neuromuscular function
- Select “measures of power” to set baseline and monitor change in function
